

THE AGENTIC ERA OF REVENUE MANAGEMENT

Making-of: AI Workflows and Trade-offs

How the launch sprint was compressed with AI while preserving strategy, judgment and brand coherence.

1. Operating principle

I did not use AI to avoid thinking. I used AI to create parallel workstreams - research, positioning, design exploration, page build, content drafting and video scripting - then used human judgment to remove hype, align the system and make trade-offs.

The goal was not to produce the most assets. The goal was to make every asset point to the same strategic claim: BEONx is moving hospitality revenue management from advisory software to supervised autonomous execution.

2. Workflow architecture

Research	Summarised the brief, public BEONx material and category language.	Separated validated claims from assumptions and placeholders.
Positioning	Generated and stress-tested category routes, taglines and pillars.	Selected the clearest, least hype-led route.
Brand	Explored logo concepts, colour hierarchy and application ideas.	Rejected generic AI symbols and built the Agentic X rationale.
Website	Structured the landing page, copy blocks and static build.	Prioritised clarity, conversion path and live deployability.
Comms	Drafted channel plan and content examples.	Removed generic language and sharpened the POV.
Video	Generated script and storyboard options.	Removed synthetic voiceover; switched to premium motion typography/captions.

3. Tools used

- LLMs: strategy synthesis, message iteration, critique, copy variants and QA prompts.
- Public research: BEONx site and public references to validate current positioning and avoid unsupported claims.
- Design/code: SVG logo prototype, HTML/CSS/JS static site, PDF documentation.
- Video: motion-typography MP4 prototype without AI voiceover after quality review.
- GitHub Pages: live landing page prototype for speed, control and reliability.

4. Where AI compressed work

- Compressed first-pass research and brief synthesis.
- Generated multiple positioning routes quickly, allowing fast critique and selection.
- Created first drafts of launch plan, content examples and video storyboard.
- Helped build reusable HTML/CSS structure and asset naming.
- Accelerated QA by checking consistency across positioning, website, comms and docs.

5. Where human judgment stayed in control

- Final positioning and category claim.
- Removal of AI clichés and vague “future of hospitality” language.
- Commercial prioritisation: pipeline, demo flow, sales enablement and HubSpot routing.
- Control narrative: supervised autonomy, not replacement or black-box automation.
- Decision to drop text-to-speech voiceover because it reduced perceived quality.
- Labelling assumptions and proof points honestly.

6. Where AI failed and how I corrected it

AI repeatedly tried to turn the launch into generic “future of hospitality” language. I rejected that direction because the buyer is sophisticated and sceptical. The final narrative is more operational: from dashboards and recommendations to supervised autonomous execution.

AI visual routes also drifted into robots, glowing brains and neon circuitry. I constrained the system back to BEONx’s palette, premium hospitality cues and UI-inspired signal graphics.

The first video used synthetic voiceover. It made the asset feel cheaper, so I replaced it with a caption-led motion typography prototype and supplied a human voiceover script as the recommended final production path.

7. What I would do with two more weeks

- Interview 3-5 customers and revenue managers to validate the narrative.
- Work with Sales/CRO to turn the positioning into objection handling and demo talk track.
- Build a HubSpot workflow for launch source tracking, scoring and nurture segmentation.
- Create SDR sequences by persona and market.
- Produce customer proof assets with validated outcomes.
- Run LinkedIn creative tests around three hooks: dashboard fatigue, supervised autonomy and meet the agents.
- Productise a reusable AI launch workflow for future category/product announcements.
