

How I Compressed a 4-6 Week Launch Sprint into 72 Hours

AI workflow, trade-offs and human judgment

Prepared by Heydar Naghiyev | Marketing Director Case Study | BEONx

Strategic spine: BEONx moves hotel revenue management from dashboards and recommendations to supervised autonomous execution.

Executive summary

I did not use AI to avoid thinking. I used AI to create parallel workstreams - research, positioning, design exploration, landing page build, content drafting and video scripting - then used human judgment to remove hype, align the system and make trade-offs.

The main human decision: coherence over volume. Every artefact points to one strategic claim: BEONx is moving hotel revenue management from recommendations to supervised autonomous execution.

Workflow architecture

Workstream	AI leverage	Human control
Research and category scan	Synthesised public BEONx proof points, competitor language and buyer pains	Selected only claims that could be supported or clearly labelled as assumptions
Positioning	Generated and stress-tested multiple category routes	Chose the operational route: from dashboards to action
Brand system	Explored logo and visual metaphors	Rejected obvious AI cliches; evolved the x instead
Landing page	Generated structure, copy variations and static code	Edited for clarity, hierarchy and buyer scepticism
Comms	Drafted launch posts, PR and thought-leadership routes	Removed hype and sharpened commercial language
Video	Built script/storyboard and motion sequence	Kept it premium and simple rather than cinematic for its own sake

Tools used

LLMs: ChatGPT/Claude-style workflows for strategy, copy iteration, critique and document synthesis. Public research: BEONx website, HotelTechReport and public search results to validate public claims. Design: SVG/manual logo system, Canva/Figma-style application mockups. Web: static HTML/CSS/JS hosted via GitHub Pages for speed, control and reliability. Video: AI-assisted script/storyboard and simple motion-typography production.

Where AI compressed work

AI compressed first-pass research, narrative routes, content variants, launch-plan structure, website copy, video scripting and QA checklists. The highest leverage came from using AI to create parallel drafts, then applying human judgment to choose and tighten the strongest route.

Where humans stayed in the loop

Final positioning, buyer empathy, anti-hype editing, risk handling, logo rationale, proof discipline, prioritisation and the decision to make a live GitHub Pages microsite rather than only submit static PDFs.

Where AI failed

AI repeatedly tried to turn the launch into generic future of hospitality language. I rejected that direction because the audience is sophisticated and sceptical. The final narrative is more operational: from dashboards and recommendations to supervised autonomous execution.

AI visual directions also drifted into robots, glowing brains, neon circuits and unrealistic hotel imagery. I constrained the system back to BEONx colours, premium hospitality cues and UI-inspired signal graphics.

Trade-offs

Decision	Why
Static GitHub Pages site instead of CMS	Fast, free, reliable and controllable for a 72-hour prototype.
Logo evolution rather than full rebrand	Preserves BEONx equity while signalling the agentic shift.
Motion typography video	More realistic than trying to produce fake cinematic AI footage under time pressure.
Placeholder proof labels	Protects credibility until internal customer metrics are validated.

What I would do with two more weeks

Interview customers, validate claims with product and sales, build a HubSpot nurture/scoring flow, create SDR sequences, produce customer-proof assets, run LinkedIn creative tests and productise the AI launch workflow into a repeatable internal system.
